Pensio

The operating system of retirement.

A national pension marketplace built for governments, citizens, and the future of sustainable retirement systems.

Retirement is quietly collapsing.

The global retirement savings gap — the difference between projected retirement savings and what people will need to retire adequately — is expected to grow **massively** from $70 trillion to **$400 trillion by 2050**.

World Economic Forum

REAL-WORLD IMPACT

A Generation's Savings, Erased

The Latvia Story

If you retired in 2022 in Latvia, with a monthly wage of **3,000 euros**, your average monthly pension would be **1,700 euros**.

If you assume the same wage when you retire in 2050, you are expected to receive just **700 euros**.

A HUGE LOSS

You lose **1000 euros** of retirement money every month until you die.

Latvia is not an outlier. It is a preview. Across ageing countries, pension systems are becoming unsustainable. And governments are barely doing anything about it.

Calculation based on **European Commission** data

THE FEE PROBLEM

People are losing money without realizing it.

A tiny fraction of a percent in hidden pension fees can quietly drain thousands from retirement savings.

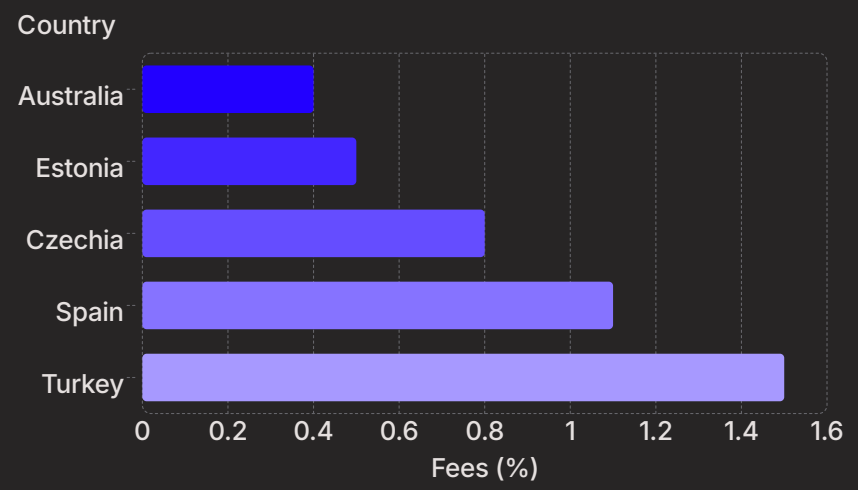
Consider someone who contributes **€5,000 every year for 30 years** with an assumed 6% annual return before fees:

With 1% Fee	With 0.5% Fee
€332,000 at retirement	**€364,500** at retirement

The math is simple — **10% of your wealth lost**. Nearly **€30,000 gone** to excessive fees over 30 years, or approximately **€1,000 per year**. Funds are able to extract this by exploiting financial illiteracy and a lack of transparency. In 2023, financially illiterate people in the US alone lose **$1,528 per person per year** due to financial mismanagement.

Financial Literacy Statistics

Annual Pension Fund Fees by Country



OECD

GLOBAL CRISIS

Governments will have to pay the bill.

Across Europe, governments have promised far more pension income than existing pension assets can finance. Estimates suggest that these unfunded pension promises total roughly **€33 trillion**.

Governments are already facing difficult choices:

- → Higher taxes on workers and businesses
- → Higher mandatory pension contributions
- → Rising public debt
- → Reduced retirement benefits
- → Increasing the statutory retirement age

OTTO

France: A National Example

France illustrates how pension financing pressure is rapidly rising.

€15B

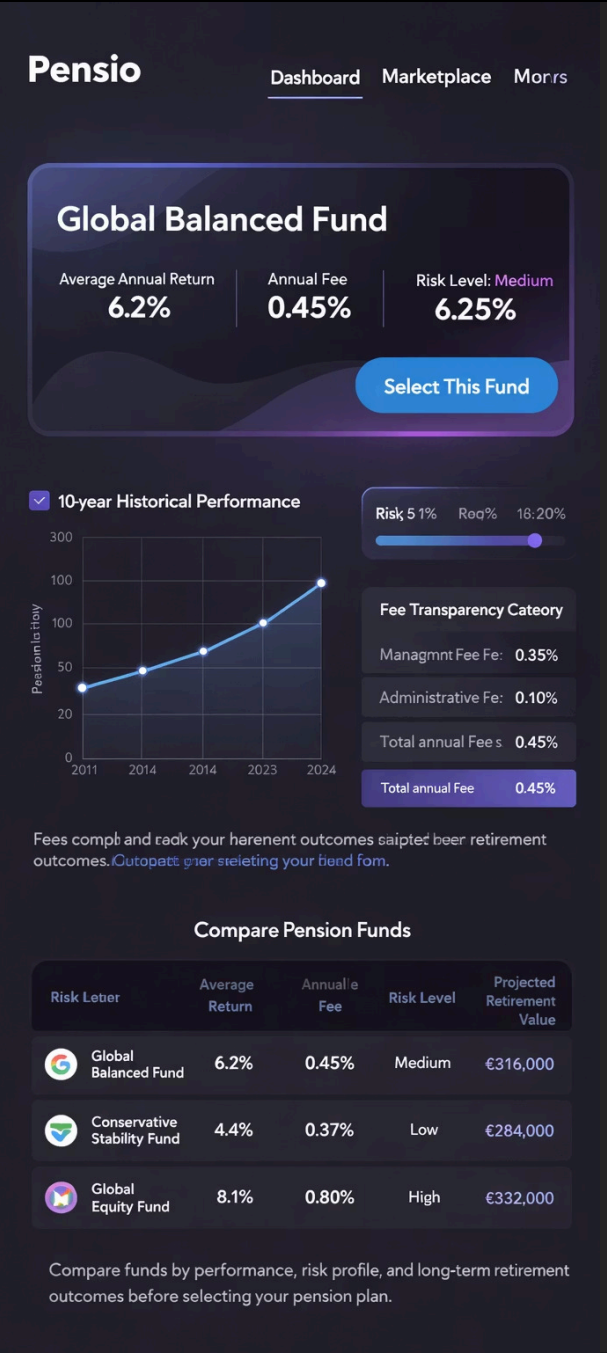
Projected annual pension deficit by 2035

€30B

Projected annual pension deficit by 2045

These figures represent the amount the French pension system would need to finance each year if no structural reforms are implemented.

Reuters



THE PRODUCT

Pensio — A Marketplace Where Funds Compete, Citizens Win, and Governments See Everything

1) Citizen Marketplace

- Transparent comparison across funds: fees, returns, risk, projections
- Personalized recomendations based on goals and risk tolerance
- Guided actions: switch, rebalance, contribute more, retire later/earlier

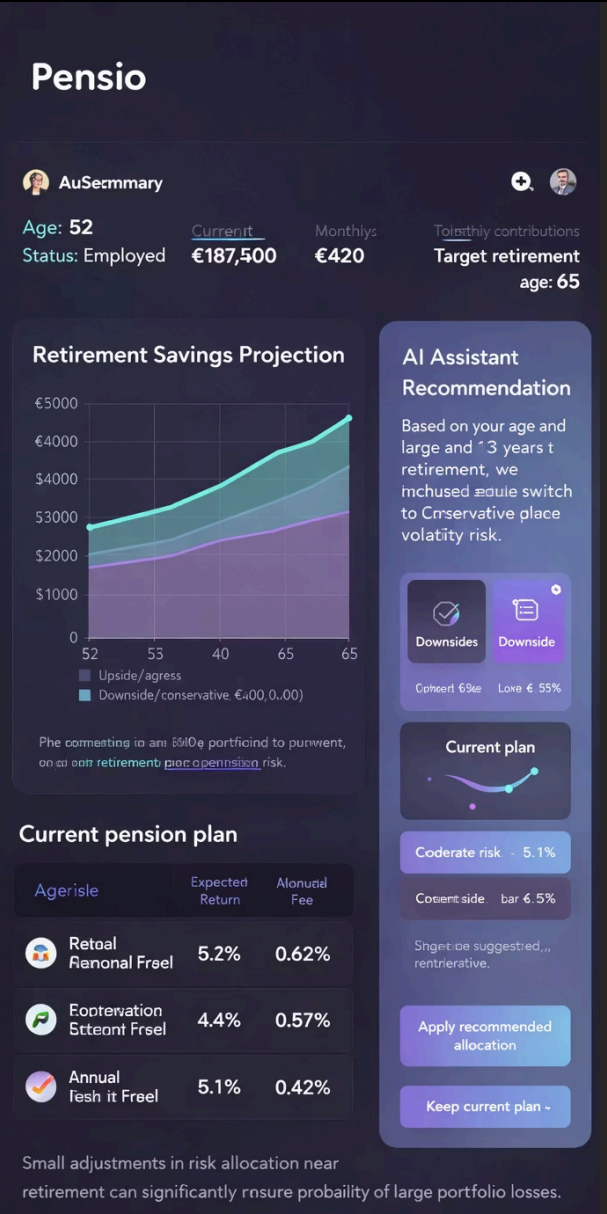
2) Pension Funds Compete Within The Platform

- Each fund has a standardized "Fund Profile" page with verified metrics
- Funds can publish their own messaging: strategy, sustainability, differentiation, education content
- Funds compete on value: net returns, transparency, service quality, and long-term outcomes

3) Government Intelligence Layer

- Real-time analytics: engagement, allocation patterns, switching behavior
- System-wide sustainability indicators and early warning signals
- Standardized reporting infrastructure reducing fragmentation and manual processes

This is hard to build and hard to replace. Once integrated into national pension infrastructure, Pensio becomes sticky: high switching costs, long contracts, and compounding data advantage.



THE SOLUTION

Pensio — What Citizens Actually Do Inside the Pension Marketplace

01

Understand

Plain-language explanations of fees, risk, and what "good" looks like.

02

Compare

Side-by-side fund comparison: performance, fees, risk profile, and retirement projections.

03

Get a Plan (AI)

Personalized AI recommendations based on your profile, behavior, and goals.

04

Act

Switch, adjust contribution ,or set a retirement goal with tracked progress over time.

In an interview, Silva Jaudzeme, a representative from Latvia's central bank working on the upgrade of the national pension education platform noted that many citizens still lack a basic understanding of the pension system, underscoring the need for tools focused on education and clear comparison.

CASE STUDY — FRANCE

A small investment. Massive fiscal leverage.

France's pension deficit is projected to reach €15 billion per year by 2035 — roughly €40 million per day in unfunded obligations.

Talis Putnins, a professor and finance expert in Australia and Latvia, noted that even in advanced systems such as Australia's superannuation market, transparency tools already exist — yet most citizens remain passive and rely on default fund management.

This reinforces the need for stronger engagement and education tools that help citizens actively manage their retirement outcomes.

Reuters

€40M

Daily deficit cost

The pace at which France accumulates unfunded pension obligations

0.11%

Platform cost ratio

Pensio's annual fee as a share of the total deficit — a rounding error in fiscal terms

A national pension transparency platform priced at around €17 million annually would represent only 0.11% of that deficit.

Even small improvements in fund allocation, voluntary savings behavior, or administrative efficiency could offset the platform cost many times over.

GOVERNMENT VALUE

How Pensio Helps Governments Manage Pension Systems

Better Policy Decisions

Governments gain a much clearer picture of how citizens are preparing for retirement. Aggregated pension data allows policymakers to see savings gaps, contribution behavior, and risk exposure across the population — enabling earlier and better-targeted interventions before problems become expensive fiscal liabilities.

Reduced Long-Term Fiscal Pressure

When citizens better understand their pension outcomes and adjust contributions or fund allocation earlier, fewer retirees depend on last-resort public support programs. Even small improvements in voluntary savings behavior or fund efficiency can significantly reduce long-term government pension spending.

Deep Pension System Analytics

Pensio provides governments with system-wide analytics they rarely have today. Instead of fragmented reporting across institutions, regulators gain a unified view of pension assets, fund performance, fee structures, and behavioral trends — enabling proactive rather than reactive pension policy.

EVIDENCE BASE

Dashboards change behavior.

Mexico & Chile

Mexico saw increased voluntary pension account openings. Chile demonstrated that **personalized retirement information increased voluntary savings** in the short term.

OECD

Sweden

OECD evidence shows improved decision confidence, increased part-time work post-retirement, and higher annuity uptake following dashboard deployment.

OECD

United Kingdom

76% of respondents said dashboards would improve retirement planning. **60%** expected to locate lost pension pots — a significant behavioral and financial benefit.

PensionsAge

Netherlands

Pension dashboard visitors showed a **35% increase in pension knowledge**, demonstrating that access to clear data directly improves financial literacy and planning capability.

Cambridge University Press

WHY NOW

Why Pension Transparency Platforms Are Emerging Now

Regulators Are Rebuilding Pension Platforms

Silva Jaudzeme highlights that the European Commission is increasingly prioritizing tools that improve pension transparency and citizen engagement.

Regulators Are Forcing More Transparency

Talis Putnins emphasizes that the Australian government is forcing superannuation funds to increase transparency around performance and fees. Yet this transparency remains fragmented across individual funds rather than centralized in a national platform.

A New Category of Public Financial Infrastructure

These developments reflect a broader shift in how governments are addressing pension system challenges. Rather than relying only on politically difficult structural reforms, regulators are increasingly investing in infrastructure that helps citizens understand their pensions, compare options, and make better retirement decisions.

The category already exists — governments are actively moving toward pension transparency infrastructure.

GO-TO-MARKET STRATEGY

Start small. Scale globally.

Pensio follows a deliberate, credibility-first expansion strategy. We build institutional trust in smaller markets before approaching large, high-value national clients. Our beachhead: **small ageing countries** with acute pension challenges and agile procurement cycles, who would struggle to finance building their own new high-quality platform.

Year 0

Aggressive market research, first LOIs, traction validation, and serious demo creation

Year 1

Pilot development and top-tier hires across product, policy, and sales, more LOIs

Year 2

First pilot running; global client search initiated

Years 3–4

Deploy across small ageing countries; build client portfolio

Years 5–6

Enter recurring large-market contracts; France, Germany, Poland tier

Year 7+

Global platform scale — infrastructure available for every national pension system

COMPETITIVE LANDSCAPE

We Are a Market Disruptor

Pension transparency platforms already exist — but they are fragmented, expensive, and slow to scale. Pensio introduces a standardized infrastructure designed to work across countries.

Key competitor: National Pension Dashboards & European Commission

Several countries already operate centralized pension dashboards — validating the need. European Commission is pushing for it. But local platforms are costly and fragmented.

- Netherlands — Mijnpensioenoverzicht
- Denmark — PensionsInfo
- Sweden — MinPension
- Belgium — MyPension
- United Kingdom — Pension Dashboard Programme

Pensio's Advantage: A standardized, modular platform governments can deploy faster and at lower cost.

Key competitor: Pension Funds

Transparency exposes underperforming funds. Clear comparisons of performance, fees, and outcomes make it easier for citizens to choose — squeezing fee margins and driving competition.

Pensio's Advantage: Standardized comparisons strengthen competitive market dynamics and improve pension outcomes for citizens.

Pensio turns fragmented transparency efforts into scalable public infrastructure.

COMPETITIVE LANDSCAPE

Risks & Opportunities.

Key Risks

Centralized Buyers

- Government procurement concentrates negotiating power in a small number of buyers.
- National contracts are awarded through long, complex public procurement processes.
- Pricing pressure can arise because negotiations happen at the national level.

Regulatory Cooperation & Complexity

- Each country requires coordination with regulators, ministries, and pension authorities.
- Pension regulation and data standards differ across jurisdictions.
- Regulatory cooperation is one of the key scaling challenges identified through expert interviews.

Key Opportunities

Infrastructure Lock-In

- National pension dashboards become core public financial infrastructure once deployed.
- Integration with regulators, pension funds, and citizen accounts creates strong switching costs.
- New entrants face high barriers due to regulatory integration and data standardization requirements.

Sticky Government Clients

- Governments rarely replace core digital infrastructure once deployed.
- Pension systems operate on multi-decade policy horizons, creating long contract lifetimes.
- Platforms embedded in national pension systems tend to become long-term public infrastructure.

BUSINESS MODEL

Simple. Scalable. Infrastructure pricing.

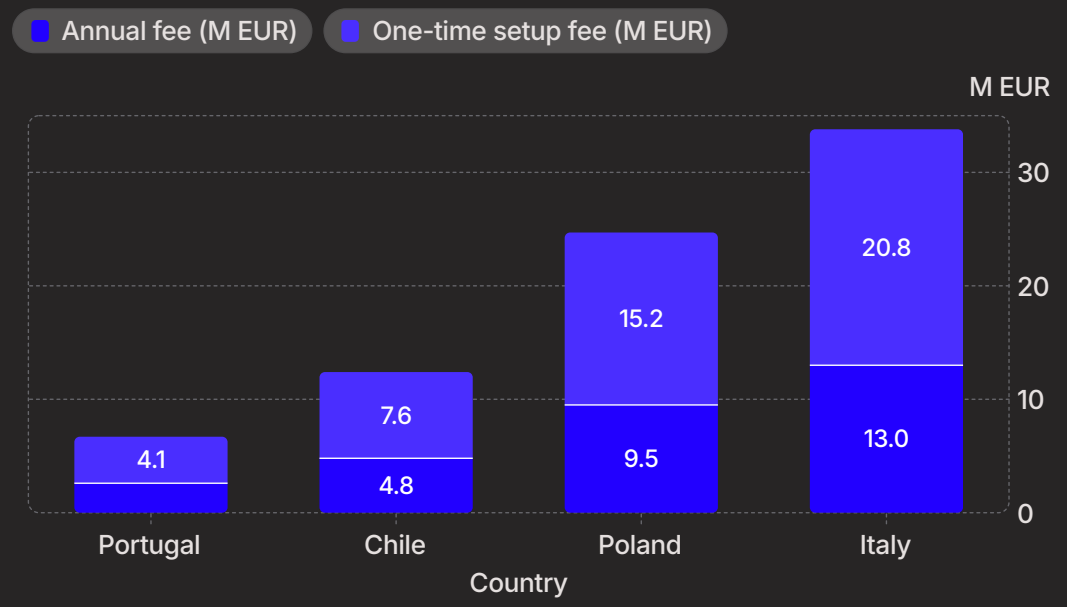
Governments pay a per-citizen annual license and a one-time implementation fee to deploy the platform nationally. Pricing is designed to be extremely affordable relative to the fiscal scale of pension systems (0.11% platform cost ratio in France) , while allowing the platform to scale across countries.

Annual License

€0.25 per citizen per year — designed to remain affordable even at national scale.

One-Time Setup Fee

€0.40 per citizen — covers national deployment, data integration, and regulatory configuration.



Large countries represent the largest leverage opportunity for Pensio — a single national deployment can generate tens of millions in revenue while costing governments only cents per citizen.

MARKET OPPORTUNITY

A few large national deployments create massive scale.

1 Large Country ~€20M ARR

3 Large Countries ~200M citizens → ~€50M ARR

5% of Global Population ~400M citizens → ~€100M ARR

Pensio does not require thousands of customers — winning a small number of large national deployments creates massive scale.

FINANCIAL PROJECTIONS

Growth through gaining credibility.

Key Assumptions

Market Entry Strategy: Pensio begins with smaller-country deployments to establish credibility before expanding to larger markets.

Deployment Timelines: National pension platforms require multi-year procurement, regulatory coordination, and system integration.

Projection Uncertainty: Financial outcomes depend heavily on which countries adopt the platform first.

Scaling Through National Deployments

Year	4	7	10
Countries	2	11	20
Avg. Population	2.4M	13.8M	36.3M
ARR	€1.6M	€28.3M	€239M
Gross Margin	57%	82%	89%
Op. Margin	–79%	39%	71%

Margins improve rapidly as the platform scales because implementation costs decline while subscription revenue grows with population coverage.

THE TEAM

Founders

Gustavs Gauja — COO

- Advisor in Financial Risk Consulting at KPMG and former econometrics intern at Latvian Central Bank.
- Built a demographic and pension projection model used by the central bank in policy presentations to the Latvian Parliament.

Krišjānis Krams — CEO

- Top finance student with experience in private equity and startup strategy, recognized for initiative, adaptability, and critical thinking.
- Supported investor search and financial strategy development at SAGA Space Architects in Denmark.

We are coursemates at the SSE Riga and have collaborated on nearly every major project during our studies because our partnership consistently works. Krišjānis drives strategic direction and planning, while Gustavs leads quantitative modelling and disciplined execution. We challenge each other's thinking openly and have proven that we can work through complex problems together — including our bachelor’s thesis on the pension adequacy crisis in Latvia.

PRE-SEED ROUND

Investment Ask

€200K

Pre-Seed Round

Funding to secure first government pilot and build a working platform prototype.

Government Outreach

Direct engagement with ministries, pension regulators, and public agencies to secure pilot deployments and LOIs.

Platform Prototype

Build a high-level interactive demo of the citizen dashboard and regulatory analytics platform.

Market Validation

Country-level pension system mapping and regulatory analysis to support pilot deployments in target markets.

> Pensio is building the infrastructure layer for national pension transparency. We are looking for partners to help bring it to governments around the world.

To ask any questions and discuss the opportunity, reach out directly to either founder.

Pensio

The operating system of retirement.

National pension transparency infrastructure — built for governments, designed for citizens.

The Problem

€33 trillion in unfunded pension liabilities across Europe. Citizens are unprepared.

The Solution

A standardized national platform for pension transparency, comparison, and analytics.

The Ask

€200K pre-seed to secure first government pilots and build the platform prototype.
